

Liquid crystal theories

Tudor Ratiu^{1,*}, ¹ EPFL, Lausanne, Switzerland, *tudor.ratiu@epfl.ch

Abstract

I will present the two competing theories for nematodynamics in liquid crystals: the Ericksen-Leslie and Eringen approaches. I will show how and when Eringen theory implies the Ericksen-Leslie equations of motion. Taking advantage of the the geometric formulation of the Ericksen-Leslie equations, the well posedness result in 3D will be stated.
